

Rešavamo sada sledeći integral pomoću Gausove kvadrature

$$I = \int_{-1}^1 x^2 dx$$

$$S = \int_{-1}^1 \int_0^2 \sqrt{1 + 4x^2 + 4y^2} \, dz \, dy \, dx = \frac{16}{3} \pi$$

Sada koristimo:

$$S(f(t)=2^{t^2+5}) \quad t_1=-0.577350269 \quad t_2=0.1$$

$$c_2=1$$

i izračunavamo:

i izračunavam

$$I_{-gq} = 2^{\frac{1}{2}} (2^{\frac{1}{2}} - 0.577350269 + 5) + 2^{\frac{1}{2}} (2^{\frac{1}{2}} \cdot 0.577350269 + 5) \$\$$$
